AB A cDNA selection technique has been used to isolate full-length human
 cDNAs of the phosphodiesterase 1 (PDE1) calcium calmodulin (CaM)-regulated
 phosphodiesterase gene family. We isolated cDNAs representing multiple
 splice variants of PDE1A, 1B and 1C from a variety of tissues. Included
 among these were two novel splice variants for PDE1A and 1B. The first,
 PDE1A5, encodes a 519-residue protein, which is different from PDE1A1 by
 the insertion of 14 residues, a divergent carboxy terminus and also
 differs from PDE1A3 through a divergent amino terminus. Our second novel
 splice variant represents the first occurrence of a splice variant of the

PDE1B gene. **PDE1B2** encodes a 516-residue protein and diverges from PDE1B1 by the replacement of the first 38 residues by an alternative 18, which is predicted to be functionally significant. Using the splice variant sequence differences to perform comparative Northern analysis, we have demonstrated that each variant has a differential tissue distribution.

AB The invention provides a **human cyclic nucleotide phosphodiesterase (HSPDE10A)**, polynucleotides that encode HSPDE10A, and antibodies that specifically bind HSPDE10A. Nucleic acids encoding HSPDE10A were identified in Incyte clone 826776 from a human prostate cDNA library and used to obtain full-length cDNA sequences from a human skeletal muscle library. HSPDE10A1 is 490 amino acids in length and has a putative cGMP binding motif and a PDE signature motif, and has chem. and structural similarity with human PDE5. A C-terminal **splice variant**, HSPDE10A2, is 367 amino acids in length and contains the same cGMP binding and PDE motifs. Northern anal. showed that HSPDE10A is expressed in skeletal muscle and prostate as a major transcript of .apprx.7.5 kb; a .apprx.3.0 kb mRNA was detected only in prostate; and a less prominent transcript of .apprx.1.5 kb occurred in testes and skeletal muscle. The invention relates to prepn. of antibodies that specifically binds HSPDE10A, and their use for immunopurifn. of the enzyme, for detection of its expression, and for diagnostic and treatment of adenofibromatous hyperplasia and other diseases. The invention also provides expression vectors, host cells, agonists, and antagonists and methods for diagnosing or treating disorders assocd. with expression of HSPDE10A.

AB The PDE1A gene encodes a Ca2+/calmodulin-stimulated 3',5'-cyclic nucleotide phosphodiesterase (PDE). The authors have performed 5' and 3' RACE and identified two addnl. 5'-**splice variants** and one addnl. 3'-**splice variant** of the human PDE1A gene. The three known 5'-**splice variants** and the two known 3'-**splice variants** combine to generate six different PDE1A mRNAs. However, one of the 5'-**splice variants** exhibits alternate splicing in the 5' untranslated region. Thus the six mRNAs encode four different PDE1A proteins. Recombinant forms of the different human PDE1A isoforms were expressed in Sf9 cells. The kinetic properties and inhibitor sensitivities of the four PDE1A isoforms are very similar to one another.

AB Human cGMP-binding, cGMP-specific 3',5'-cyclic nucleotide phosphodiesterase (PDE5A) cDNAs were isolated. A 3.1-kb composite DNA sequence assembled from overlapping cDNAs encodes an 875-amino-acid protein with a predicted mol. mass of 100,012 Da (PDE5A1). Exts. prepd. from yeast expressing human PDE5A1 hydrolyzed cGMP. This activity was inhibited by the selective PDE5 inhibitors zaprinast and DMPPO. PDE5A mRNA is expressed in aortic smooth muscle cells, heart, placenta, skeletal muscle and pancreas and, to a much lesser extent, in brain, liver and lung. A 5'-**splice variant**, PDE5A2, encodes an 833-amino-acid protein with eight unique amino acids at the amino terminus. PDE5A maps to chromosome 4q25-27.
